

ABSTRACT

A method and system implemented in an application
programming interface (API) and an object model allows program
5 code developers to interface in a consistent manner with a
scene graph data structure to output graphics. Via the
interfaces, program code writes drawing primitives such as
geometry data, image data, animation data and other data to
visuals that represent a drawing surface, including validation
10 visual objects, drawing visual objects and surface visual
objects. The code can also specify transform, clipping and
opacity properties on visuals, and add child visuals to other
visuals to build up a hierarchical scene graph. A visual
manager traverses the scene graph to provide rich graphics data
15 to lower-level graphics components.
